

PROJECT HOSTS™

Security Compliant Clouds

Healthcare Security Envelope

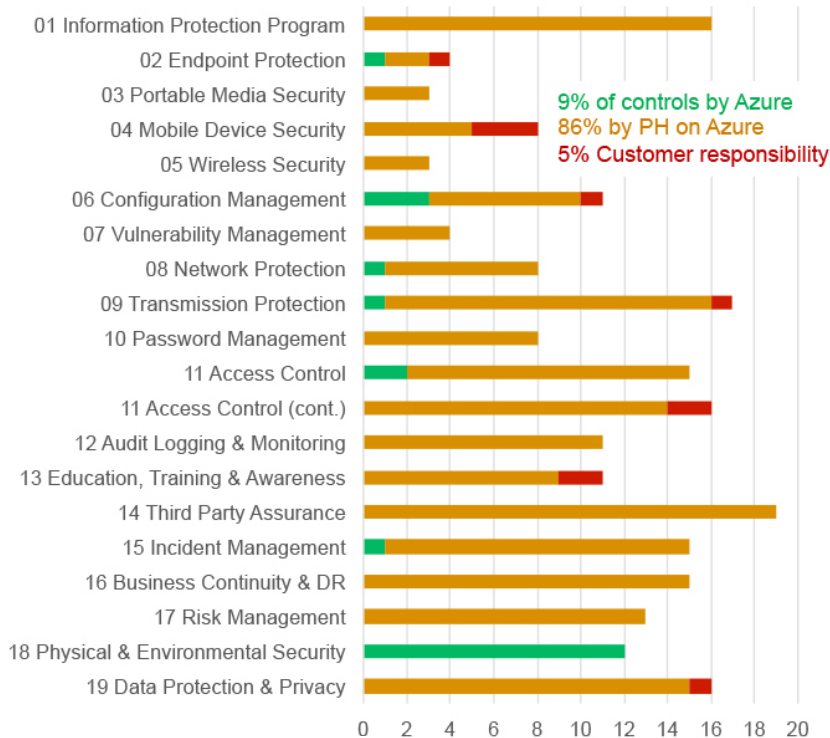

Project Hosts' pre-audited HITRUST environments give healthcare organizations turnkey compliance for their applications, removing a key barrier to migration from on-premises or AWS deployments into Microsoft Azure.

Our Healthcare Security Envelope, extends Azure's built in IaaS and PaaS security compliance, adding healthcare compliance to Azure services and solutions. This ensures that all ePHI (electronic Personal Health Information) is fully protected in your digital transformation.

With more than 15 years of expertise in securing Microsoft cloud solutions, Project Hosts' security team understands the exact control responses, technical implementations, and evidence that are required to demonstrate full SaaS compliance with the HIPAA and HITRUST standards for a healthcare environment built on Microsoft Azure.

Below you see the Security Controls covered by Azure, Project Hosts and the customer's responsibilities:

Healthcare Pain Points:

- Healthcare entities must secure ePHI (electronic protected health care information) by meeting HIPAA regulatory requirement
- HITRUST mandates encryption of data in transit and at rest
- Non-compliance can mean criminal and civil penalties reaching upwards of \$1.5 million per incident, per year.
- HITRUST compliant – Healthcare entities are now requiring HITRUST compliance Likely that HITRUST will become a U.S. Gov regulatory standard
